VIEWS
In The Spotlight
Understanding the Lethal Variant of Prostate Cancer: Power of Examining Extremes 466
A. Aparicio, C. J. Logothetis, and S.N. Maity
Commentary on Beltran et al., p. 487

NF-κB in Cancer: A Matter of Life and Death 469
B.B. Aggarwal and B. Sung
Commentary on Enzler et al., p. 496

HER2 Signaling and Resistance to the Anti-EGFR Monoclonal Antibody Cetuximab: A Further Step toward Personalized Medicine for Patients with Colorectal Cancer 472
F. Ciardiello and N. Normanno
Commentary on Bertotti et al., p. 508

RESEARCH ARTICLES
mTORC 2:1 for Chemotherapy Sensitization in Glioblastoma 475
W. Wick, J. Blaes, and M. Weiler
Commentary on Tanaka et al., p. 524

Prospetive
Curing “Incurable” Cancer 477
J.D. Watson

REVIEW
PI3K and STAT3: A New Alliance 481
P.K. Vogt and J.R. Hart

RESEARCH BRIEF
Molecular Characterization of Neuroendocrine Prostate Cancer and Identification of New Drug Targets 487
Précis: Frequent AURKA and MYCN amplification is identified in an aggressive prostate cancer subtype.

Cell-Selective Inhibition of NF-κB Signaling Improves Therapeutic Index in a Melanoma Chemotherapy Model 496
T. Enzler, Y. Sano, M-K. Choo, H.B. Cottam, M. Karin, H. Tsao, and J.M. Park
Précis: Host- and tumor-specific cellular responses, respectively, underlie the adverse and therapeutic effects of NF-κB blocking agents.
A Molecularly Annotated Platform of Patient-Derived Xenografts ("Xenopatients") Identifies HER2 as an Effective Therapeutic Target in Cetuximab-Resistant Colorectal Cancer ................. 508

Précis: Population-based preclinical testing identifies HER2 amplification as a novel biomarker of cetuximab resistance in metastatic colon cancer and indicates dual targeting of HER2 and EGFR may be a more effective therapeutic approach.

Tanaka and colleagues demonstrate that mTORC2 is activated in the majority of glioblastomas and mediates chemoresistance in an AKT-independent manner via NF-κB pathway activation. Surprisingly, they show increased activity of this mTORC2–NF-κB signaling pathway in GBM cells in response to rapamycin, which may provide an explanation for the failure of rapamycin to demonstrate efficacy in GBM clinical trials. Instead, dual mTOR kinase inhibitors that block the activity of both mTORC1 and mTORC2 may improve clinical outcome, particularly when combined with other chemotherapeutic agents. For details, please see the article by Tanaka and colleagues on page 524.
