NEWS IN BRIEF

REVIEW
Promising SINEs for Embargoing Nuclear–Cytoplasmic Export as an Anticancer Strategy ........... 527

RESEARCH BRIEFS
Efficacy of Intermittent Combined RAF and MEK Inhibition in a Patient with Concurrent BRAF- and NRAS-Mutant Malignancies .... 538

Précis: Intermittent combined use of the RAF inhibitor vemurafenib and the MEK inhibitor cobimetinib in a patient with BRAF-mutant melanoma and NRAS-mutant leukemia controlled both diseases.
See commentary, p. 510

Activating mTOR Mutations in a Patient with an Extraordinary Response on a Phase I Trial of Everolimus and Pazopanib .... 546

Précis: The identification of two activating MTOR mutations in a patient who experienced a complete response to everolimus and pazopanib suggests an underlying mechanism of mTOR inhibitor sensitivity.
See commentary, p. 513

A Diverse Array of Cancer-Associated MTOR Mutations Are Hyperactivating and Can Predict Rapamycin Sensitivity ........ 554

Précis: Activating MTOR mutations are widespread in human cancers and correlate with hypersensitivity to mTOR pathway inhibition.
See commentary, p. 513

VIEWS

In this issue...
Vemurafenib treatment was previously shown to uncover an NRAS-mutant chronic myelomonocytic leukemia (CMML) in a patient with BRAF-mutant metastatic melanoma. Abdel-Wahab and colleagues report that the combination of vemurafenib and the MEK inhibitor cobimetinib blocked vemurafenib-induced CMML proliferation and restored normal white blood cell counts in this patient. Intermittent administration of vemurafenib and cobimetinib has durably maintained a near-complete melanoma response and has prevented CMML progression in association with decreased levels of CMML-derived circulating tumor DNA and reduced ERK activation in monocytes. Intermittent combination RAF and MEK inhibitor therapy may thus be useful for treatment of RAS-driven malignancies arising due to paradoxical activation of wild-type RAF by RAF inhibitors in RAS-mutant cells. For details, please see the article by Abdel-Wahab and colleagues on page 538.

NUP98–PHF23 Is a Chromatin-Modifying Oncoprotein That Causes a Wide Array of Leukemias Sensitive to Inhibition of PHD Histone Reader Function .................. 564
Précis: The NUP98–PHF23 fusion induces hematologic malignancies marked by Hoxa and Meis1 overexpression and confers sensitivity to small molecules that block PHD domain binding to H3K4me3.

A Small-Molecule c-Rel Inhibitor Reduces Alloactivation of T Cells without Compromising Antitumor Activity ...... 578
Précis: c-Rel is required for T-cell activation in grant-versus-host disease but is dispensable for graft-versus-tumor activity.

A Functional Cancer Genomics Screen Identifies a Druggable Synthetic Lethal Interaction between MSH3 and PRKDC ................. 592
See commentary, p. S16

Reduced NF1 Expression Confers Resistance to EGFR Inhibition in Lung Cancer .............................................. 606
Précis: NF1 deficiency sustains MAPK pathway activation and reduces sensitivity to EGFR kinase inhibitors in the absence of the EGFR T790M mutation.
See commentary, p. S19
