## REVIEW

A Next-Generation TRK Kinase Inhibitor Overcomes Acquired Resistance to Prior TRK Kinase Inhibition in Patients with TRK Fusion–Positive Solid Tumors .... 963
Précis: Parallel development of the first-generation TRK TKI larotrectinib with the next-generation TKI LOXO-195 allowed for rapid use of LOXO-195 to treat patients with acquired larotrectinib resistance.
See commentary, p. 934

Exome Sequencing of African-American Prostate Cancer Reveals Loss-of-Function ERF Mutations ......... 973
Précis: Sequencing of an African-American prostate cancer cohort identified ERF as a tumor suppressor in prostate cancer and shows that increasing ethnic diversity enhances the discovery of potential cancer drivers.
Secondary Somatic Mutations Restoring RAD51C and RAD51D Associated with Acquired Resistance to the PARP Inhibitor Rucaparib in High-Grade Ovarian Carcinoma ....... 984

Précis: In patients with high-grade ovarian carcinoma treated with the PARP inhibitor rucaparib, secondary reversion mutations in HR genes restore the open reading frame and HR activity to confer resistance. See commentary, p. 937
See article, p. 999
See article, p. 1006

Analysis of Circulating Cell-Free DNA Identifies Multiclonal Heterogeneity of BRCA2 Reversion Mutations Associated with Resistance to PARP Inhibitors ....... 999

Précis: Multiclonal BRCA2 reversion mutations were detected in circulating cell-free DNA from two patients with metastatic prostate cancer after PARP inhibitor treatment, suggesting a mechanism of resistance. See commentary, p. 937
See article, p. 984
See article, p. 1006

Circulating Cell-Free DNA to Guide Prostate Cancer Treatment with PARP Inhibition .................. 1006

PARP inhibitors (PARPi) have demonstrated activity in patients with mutations in homologous recombination (HR) genes such as *BRCA1* and *BRCA2*. Three related studies identified HR gene reversion mutations that confer resistance to PARPi. Kondrashova and colleagues discovered secondary reversion mutations in *BRCA1*, *RAD51C*, and *RAD51D* in patients with PARPi-resistant ovarian cancer. Similarly, Quigley, Alumkal, and colleagues identified *BRCA2* reversion mutations associated with PARPi resistance in circulating cell-free DNA (cfDNA) from two patients with prostate cancer. Finally, Goodall, Mateo, and colleagues found secondary reversion mutations in *BRCA2* and *PALB2* in cfDNA from patients with PARPi-resistant metastatic prostate cancer. Together, these studies demonstrate that HR gene reversion mutations can promote resistance to PARPi. For details, please see the article by Kondrashova and colleagues on page 984, the article by Quigley, Alumkal, and colleagues on page 999, and the article by Goodall, Mateo, and colleagues on page 1006.
