Supplementary Figure 3. Treg depletion from c-Rel deficient donor T-cells results in exacerbated GVHD. Lethally irradiated BALB/c recipients were transplanted with C57BL/6 TCD BM cells with $0.5 \times 10^6$ C57BL/6 WT or FoxP3-DTR T-cells. T-cells were treated with c-Rel inhibitor for 24 hours before transplantation. Diphtheria toxin (DT) was administered on day 13 after HSCT to eliminate donor Tregs in recipients transplanted with FoxP3-DTR T-cells ($n = 8$).
