**Supplementary Figure 4.** Pre-treatment of donor T-cells with a c-Rel antagonist promotes IL-2 secretion *in vivo*. Lethally irradiated BALB/c recipients received C57BL/6 TCD BM cells with $0.5 \times 10^6$ C57BL/6 WT T-cells after 24 hours of pre-treatment with c-Rel inhibitor compound IT-603 or with empty vehicle solution as a control. IL-2 secretion from donor CD4$^+$ T-cells in the spleen on day 4 is shown. Mean values and SEM are presented ($n = 5$). *, $P < 0.05$. Data are representative of two independent experiments.
